GROSS DOMESTIC PRODUCT
December Quarter 2016

Gross Domestic Product (GDP) for December Quarter 2016 at current market prices was \$105.7 million decreasing by 1.9 per cent when compared to September quarter 2016. When compared to December quarter 2015, value added had increased slightly by 1.0 per cent.

At constant 2006 prices, December quarter 2016 recorded a value of \$84.7 million. This resulted in a decrease of 4.1 per cent in economic activity when compared to September quarter 2016. An increase of 3.8 per cent in economic activity was experienced when compared to December Quarter 2015.

Graph 1 below shows total quarterly GDP at Current and Constant Prices.

According to graph 1, seasonal fluctuations show that economic activity starts to slow down during the December quarter. This is mainly due to the decrease in visitor numbers during this period.

Graph 2 below shows the percentage change of GDP at constant prices by industry over the same quarter of previous year. According to the graph, the largest increases were from the construction industry (up 27%), financial intermediation services indirectly measured (up 24.4%) and electricity and water supply (up 13.8%). The largest offset came from the fishing and pearl industry decreasing by 22.9 per cent.

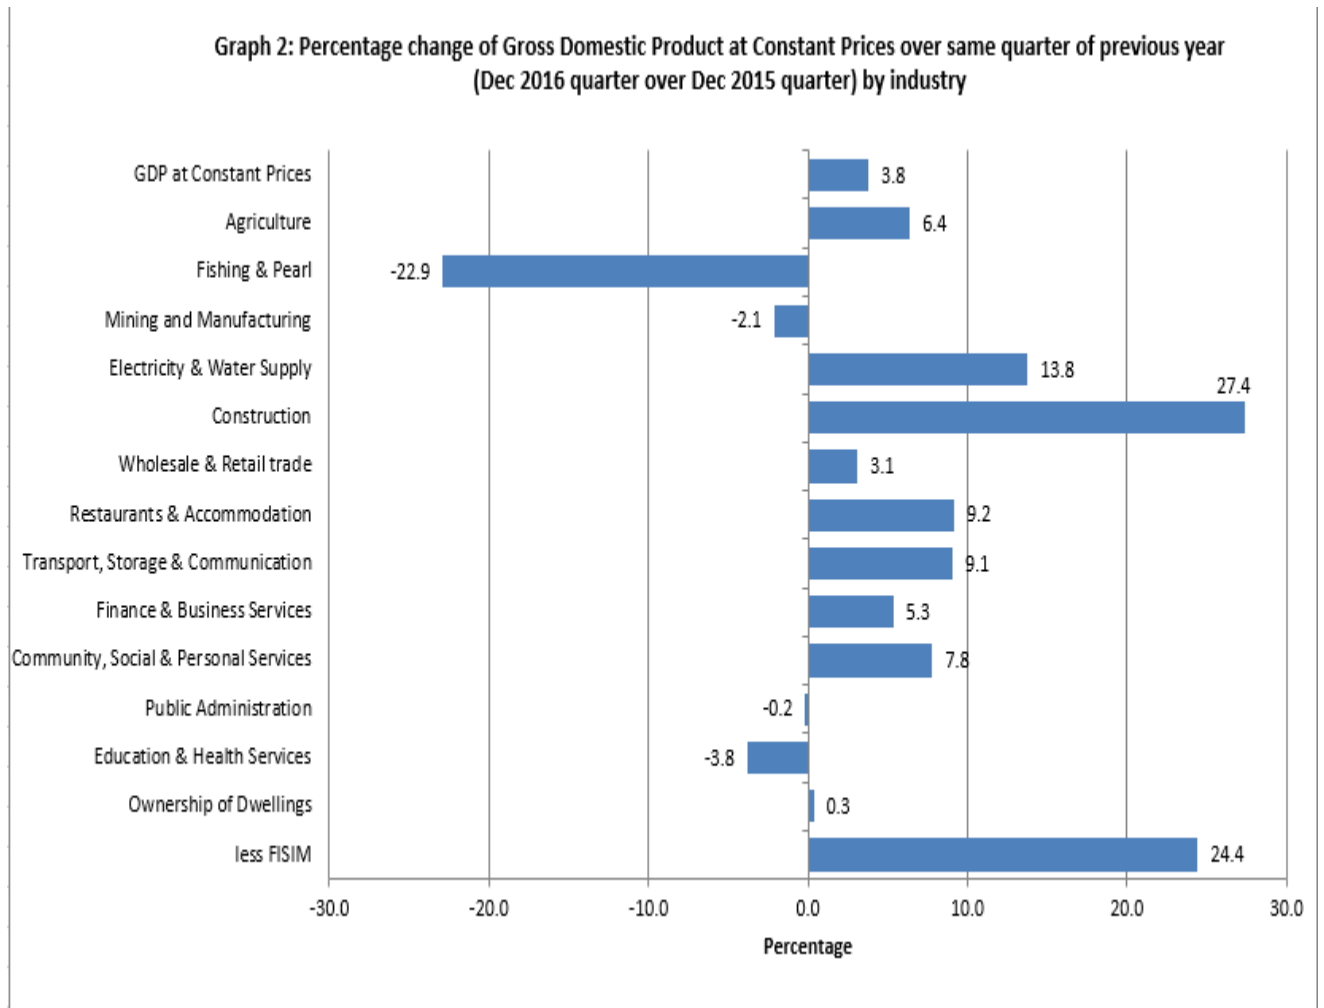

Chart 1 below shows the percentage share of GDP at real prices. The tertiary sector presented the largest share to GDP with the main contributions coming from the restaurants and accommodation industry with 22.7 per cent, followed closely by, wholesale and retail trade (19.5%), transport, storage and communication (15.8%) and finance and business services (13.4%). The secondary sector contributed 7.9 per cent to total GDP, while the primary sector contributed 5.7 per cent.

Chart 1: Percentage share of GDP at constant prices - December 2016

Explanatory Notes

Gross Domestic Product (GDP) is the measure of economic growth in the Cook Islands.

GDP Compilation Approaches

There are three different approaches taken to calculate GDP - the production approach, the expenditure approach, and the income approach.

The production approach (GDP (P)) is being used to calculate the Cook Islands GDP on a quarterly basis. This approach measures the total value of goods produced in the Cook Islands, after deducting the cost of goods and services used in the production process. Generally the GDP in this approach is calculated as, the total Gross Output (GO) less Intermediate Consumption (IC).

Scope and Coverage of the GDP

GDP is calculated for all economic activities in the Cook Islands. These activities include Agriculture and Fishing; Mining and Manufacturing; Electricity, Gas and Water; Construction; Retail and Wholesale Trade; Restaurants and Accommodation; Transport, Storage and Communication; Financial Intermediation; Real Estate, Renting and Business Services; Education, Health and Public Administration; Other Services; and Owner Occupied Dwellings.

International Standard Industrial Classifications (ISIC Rev 4) – is used to classify the principal economic activity (industry) of establishments and enterprises. At the broader industry groupings:

- Primary industries include agriculture, fishing and pearl
- Secondary industries include mining and manufacturing; electricity and water supply; and construction.
- Tertiary or service industries include wholesale and retail trade; restaurants and accommodation; transport, storage, cartage and communication services; Finance and Business Services; Community and Personal Services; Public Administration; Education and Health Services; Ownership of Owner-Occupied Dwellings.

General information

Data Source

VAT data is the main data source in the compilation of GDP. Other data sources and methods are found in the table for the methodology of compiling the Cook Islands quarterly GDP on request.

System of National Accounts

The conceptual framework used to compile the Cook Islands GDP is based on the System of National Accounts 1993.

GDP Implicit Price Deflators

Implicit price deflators (IPDs) for expenditure on GDP provide a broad measure of price change for total economic activity. They provide an estimate of price change between the base period and any other period, using the quantity weights in the latter period. Because weights change from period to period, a change in an IPD between any two periods reflects changes in both actual prices and weights or compositional changes. It is calculated as GDP at current prices divided by GDP at constant prices and multiply by 100.

Per capita measures

A per capita measure is the annual GDP (at current or average prices) divided by the corresponding projected population of the Cook Islands. We use the average estimated resident population of the Cook Islands.

Base period for the GDP

The base period is the calendar year ending 31 December 2006.

Revisions policy

We may revise previously published series each quarter. The frequency and cause of these revisions are listed below.

Quarterly – more data becoming available for the latest quarters, which is used to replace existing estimates.

Annual – introduction of annual data after the release of the latest annual national accounts.

Irregular – for example, methodological changes.

Publication Schedule

Compilation and release of calendar year GDP data is within six to nine months after reference year.
